

The following chromatogram and conditions were run on a 250 x 4.6mm C18. I would recommend a Synergi Fusion-RP under the conditions specified under the chromatogram.

**Figure 1.** HPLC chromatogram showing allicin (retention time, 9.95 min) and diallyl sulfone internal standard (retention time, 5.77 min). Conditions: C-18 column, 195 nm, acetonitrile (ACN):H<sub>2</sub>O at 30:70.
